Hibernate

Optimization: Summary

Summary

- Premature optimization is the root of all evil
- If your DB is under load use better techniques:
  - Check the SQL that's generated
    - Make sure no Cartesian Product
  - If you find N+1 problems use:
    - Dynamic: EntityGraph, or JoinFetch
    - Static: @BatchSize, or SubSelect
- Use Caching (or scaling) to further reduce load
